

ABSTRACT OF THE DISCLOSURE

A recycling analyzing system comprising: a standard operation time memory which stores standard time for disassembling operation of each component beforehand;
5 an operation time memory which stores time for disassembling operation of each component to be disassembled; an operation time counting unit which counts the time for disassembling operation time of each component constituting the item to be recycled, and stores them in the operation time memory; and a difficult operation extracting unit which refers to the standard time stored in the standard operation time memory, and the time for
10 disassembling operation of each component stored in the operation time memory, and extracts disassembling operations which is difficult.
